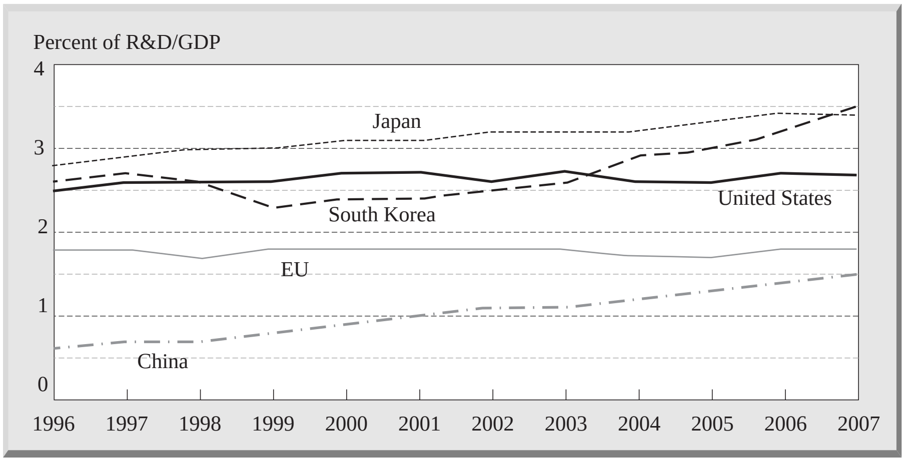
R&D/GDP Ratios of Selected Countries and the EU (1996-2007)



EU = European Union, GDP = Gross Domestic Product, R&D = Research and Development

The graph shows the R&D/GDP ratios of selected countries — Japan, the U.S., South Korea, and China — and the EU. ① Over the 1996-2007 period, the economies of the three Asian countries led to an increase in their R&D/GDP ratios; conversely, the ratios of the U.S. and the EU essentially held steady. ② Japan's R&D expenditures amounted to about 3.4% of its GDP in 2007, and those of South Korea increased steeply in the 2000s, accounting for about 3.5% of its GDP in 2007. ③ South Korea's R&D/GDP ratio fell behind that of the U.S. from 1996 to 2003, but the former surpassed the latter after 2004. ④ Meanwhile, China's R&D/GDP ratio more than doubled from 1996 to 2007, a period during which China's economy expanded rapidly. ⑤ Overall, South Korea and China are the countries which showed the biggest increases in R&D/GDP ratios among the four countries and the EU.
