Texting seems to meet a new communicative need in a society where increased pressures on time and short attention spans are increasingly the norm. The medium appeals to people who do not want to waste time engaging in the linguistic hand-shaking that is needed in traditional face-to-face or voice telephone conversations — what has sometimes been called ‘phatic communion’ in linguistics. In those contexts it is normal polite behavior to exchange social messages on meeting someone (*How are you?*, *Nice day ...*), and in some languages the conversational rituals of greeting and farewell are quite elaborate. None of this is required in texting, where the messages are typically short and direct, and introduced with few or no opening remarks. In a face-to-face setting, they would seem abrupt or even — depending on the relationship between the participants — rude.

* phatic communion 사교적 언어 사용

Memory is a very basic aspect of cognition, so we might expect it to operate in much the same manner among human beings everywhere. This is true: No matter where they live and in what culture, people all around the world have the same basic memory abilities. This does not mean, however, that memory is unaffected by culture. For example, in many industrialized societies, students learn as part of their education to remember lists of unrelated terms and practice entering abstract information such as mathematical and chemical equations into their memories. In traditional societies, in contrast, individuals have little if any practice with such tasks. People in these societies, too, commit large amounts of information to memory; but most of it is directly linked to their daily lives. They only memorize the names of large numbers of plants and animals that are a part of everyday life.
