Given the growing human population, it is difficult to imagine a complete stop to habitat destruction. However, biologist Norman Myers and his collaborators have concluded that twenty-five biodiversity “hotspots,” making up less than two percent of Earth’s surface, contain up to fifty percent of all mammal, bird, reptile, amphibian, and plant species. Hotspots occur in areas of the globe where favorable climate conditions lead to high levels of plant production, such as rain forests, and where geological factors have resulted in the isolation of species groups, allowing them to diversify. Stopping habitat destruction in these hotspots could greatly reduce the global extinction rate. Of course, preserving these biodiversity hotspots is not easy, but by focusing conservation efforts on hotspot areas at the greatest risk, humans can very quickly prevent the loss of a large number of species.

Newspapers love to print stories about five-year-old musical prodigies giving solo recitals, but you rarely read about one going on to become a Mozart. The point here is that whatever his initial gift, Mozart was also an artist who learned to work on his work, and thereby improved. In that respect he shares common ground with the rest of us. Artists get better by sharpening their skills or by acquiring new ones; they get better by learning to work, and by learning *from* their work. They commit themselves to the work of their heart, and act upon that commitment. So when you ask, “Then why doesn’t it come easily for me?”, the answer is probably, “Because making art is hard!” What you end up caring about is what you *do*, not whether the doing came hard or easy.
