Undeniably, cancer comes with age. Eighty percent of all cancers happen after age sixty-five, and by the end of life about one-third of us will be stricken by cancer. But cancer is not due to aging itself. It strikes later in life because a long life span provides cancer a longer incubation period in which to develop. Cancer is not an overnight phenomenon like an infection; it is a long, slow process that happens over twenty, thirty, or forty years, as cells are bombarded by free radicals, causing initial mutations in genetic DNA, followed by years of tiny encouragements to grow into a tumor and then to spread to other tissues in the body. A cancer discovered today is the result of free radical catastrophes that began occurring several decades ago and are still piling up.

Consider an eight-year-old girl who is given a hammer and nail to hang a picture on the wall. She has never used a hammer, but from observing others do this she realizes that a hammer is an object to be held, that it is swung by the handle to hit the nail, and that it is usually swung a number of times. Recognizing each of these things, she fits her behavior into this schema she already has (assimilation). But the hammer is heavy, so she holds it near the top. She swings too hard and the nail bends, so she adjusts the pressure of her strikes. These adjustments reflect her ability to slightly alter her conception of the world (accommodation). Just as both assimilation and accommodation are required in this example, so are they required in many of the child's thinking challenges.
