Behavioral evidence for separate types of taste receptors comes from studies of the following type: Soak your tongue for 15 seconds in a sour solution, such as unsweetened lemon juice. Then try tasting some other sour solution, such as dilute vinegar. You will find that the second solution tastes less sour than usual. Depending on the concentrations of the lemon juice and vinegar, the second solution may not taste sour at all. This phenomenon, called adaptation, reflects the fatigue of receptors sensitive to sour tastes. Now try tasting something salty, sweet, or bitter. These substances taste about the same as usual. In short, you experience little cross-adaptation—reduced response to one taste after exposure to another. Evidently, the sour receptors are different from the other taste receptors. Similarly, you can show that salt receptors are different from the others and so forth.

The fact that the intensity of a taste is ____ (A) ____ after trying the same taste, but not after trying a different taste, serves as evidence for the existence of ____ (B) ____ receptors for different tastes.

- | (A) | | (B) | (A) | | (B) |
|-------------|-------|------------|-------------|-------|-----------|
| ① increased | | adaptive | ② increased | | identical |
| ③ measured | | sensitive | ④ decreased | | distinct |
| ⑤ decreased | | collective | | | |

Words & Phrases

- separate 별개의
- solution 용액
- depending on ~에 따라서
- fatigue 피로, 피곤
- exposure 노출

- receptor 감각기
- dilute 묽은, 싱거운
- concentration (액체의) 농도
- substance 물질
- evidently 분명히

- soak 적시다, 담그다
- vinegar 식초
- phenomenon 현상
- cross-adaptation 교차 적응
- intensity 강도, 농도
