Educational psychologist Diane Horgan raises the interesting point that a better understanding of one's skill level is not necessarily the result of greater skill. ① Instead, the causation can run in the other direction: Realistically understanding your skill level might help you improve by enabling you to adjust your expectations, properly gauge feedback, identify your strengths and weaknesses, and so on. ② If you are overconfident in your ability, you may also be less motivated to improve it. ③ Making people more competent is the way to make them better judges of their competence. ④ After all, you “know” that you are already good, so you don't need to practice more. ⑤ These considerations should give pause to supporters of increasing children's self-esteem as a comfort for educational underachievement.

Stabilizing our climate would help resolve what many scientists consider to be the gravest environmental danger humankind has ever faced. Each of us has a part to play in shifting our culture toward a way of life that respects the natural world. The choices we make and the way we live can play roles in turning the tide. By eating in a way that is suitable both for our own health and for the health of the biosphere, we can help our society to face and to turn around the enormous environmental challenges of our times. The more people move toward plant-based food choices, the greater the possibility that our species will not only survive, but will thrive. A cultural shift toward a plant-based diet would be a step toward environmental sanity. It would be an act of love for all generations yet to come.
