다음 글의 목적으로 가장 적절한 것은?

I read “The Body Engineers” in your July issue hoping for a variety of perspectives on hormone research and aging, and I was not disappointed. However, some opinions concerned me, as they are representative of what doctors have been telling me to get me to stop hormone replacement therapy. It is unreasonable and unfair for the medical community to conclude that because some hormones may increase the risk of certain health problems, almost no one should take them. Many people may benefit from hormone therapy without developing problems. Perhaps doctors should pay more attention to risks versus benefits for individual patients rather than making global generalizations. I hope there is a middle ground between viewing aging as a disease where every “symptom” is to be prevented or eradicated, and viewing it as a totally natural process for which nothing is to be done.

* eradicate 뿌리 뽑다, 근치하다

밑줄 친 he[He]가 가리키는 대상이 나머지 넷과 다른 것은?

I am the mother of a very intelligent fifth grader. He consistently scores in the 99th percentile on standardized school tests in math, language and science, but ① he has had some very real “self-worth” problems. My husband, who is also an intelligent person, felt his parents never valued intellect and ② he has overcompensated with our son in attempting to praise him for “being smart.” Over the past years, I have suspected this was causing a problem, because my son, while ③ he easily excels in school, is reluctant to take on more difficult work or projects because then he would think he’s not smart. ④ He projects an over-inflated view of his abilities and claims he can perform better than others (both intellectually and in physical activities), but will not attempt such activities, because of course, in his failure ⑤ he would be shattered.
