I go into the high-ceilinged stacks and wander among the shelves, searching for a book that looks interesting. Gentle early-summer sunlight is shining through the open window, the chatter of birds in the garden filtering in. A shelf farther back contains general humanities — collections of world literature, individual writers, and classics. When I open them, most of the books have the smell of an earlier time leaking out between the pages — a special odor of the knowledge and emotions that for ages have been calmly resting between the covers. Since the library has just opened for the day, there's no one else there and I have the elegant reading room all to myself. Every once in a while a gentle breeze blows in through the open window, the white curtain rustling softly in air that has a hint of the sea.

14 (A), (B), (C)의 각 네모 안에서 문맥에 맞는 낱말로 가장 적절한 것은?

A 2001 report reviewed eighty-one research projects conducted over fifteen years and failed to find any new (A) benefits / risks to human health posed by genetically modified crops. Genetically modified foods are no more dangerous than “natural” foods because they are not fundamentally different from natural foods. Virtually every animal and vegetable has been “genetically modified” for millennia by selective breeding. Plants do not have any particular desire to be eaten, so they did not go out of their way to be tasty, healthy, or easy for us to grow and harvest. On the contrary, they did go out of their way to (B) prevent / protect us from eating them, by evolving irritants, toxins, and bitter-tasting compounds. So there is nothing especially safe about natural foods. The “natural” method of selective breeding for pest resistance simply (C) increases / reduces the concentration of the plant's own poisons.
