Parents often fail to address early childhood lying, since the lying is almost innocent—their child is too young to know what lies are, or that lying is wrong. When their child gets older and learns those distinctions, the parents believe, the lying will stop. This is dead wrong, according to Dr. Victoria Talwar. The better a young child can distinguish a lie from the truth, the more likely he or she is to lie given the chance. Researchers test children with elegant anecdotes, and ask, “Did Suzy tell a lie or tell the truth?” The kids who know the difference are also the most prone to lie. Ignorant of this scholarship, many parenting websites and books advise parents to just let lies go—kids will grow out of it. The truth is, kids grow into it.

- ① how to stop children from lying
- ② the necessity of learning to let go
- ③ the misconception about children’s lies
- ④ effective strategies for educating children
- ⑤ the effects of trust on children’s personalities

Because classical music today has largely become something we listen to in concert or on recordings, it is easy to forget the essential role it once played as a part of daily life. An enormous amount of the music written in the Baroque period and earlier was designed to support dancing. Supplying music for dancing was an essential task for nearly every composer until the twentieth century. Vast quantities of dance music were written in the Baroque period because people danced all the time, and composers had to supply music to match the demand. As time passed, however, dance music gradually became more abstract and sophisticated and eventually left its original real-world function behind. Put simply, the minuet, which was originally designed to be danced to, ultimately became something to listen to, and the switch transformed both content and form.

A species that survives by eating another species is typically referred to as a predator. The word brings up images of some of the most dramatic animals on Earth: cheetahs, eagles, and killer whales. You might not picture wood warblers, a family of North American bird species characterized by their small size and colorful feathers, as predators; however, these beautiful birds are huge consumers of insects. The hundreds of millions of individual warblers collectively remove literally tons of insects from forest trees every summer. Most of these insects prey on plants. By reducing the number of insects in forests, warblers reduce the damage that insects inflict on forest plants. The results of a study that excluded birds from white oak seedlings showed that the trees were about fifteen percent smaller because of insect damage over two years, as compared to trees from which birds were not excluded.

Corporations were once task-oriented groups, created in the nineteenth century through charters to perform specific projects like canal or railroad building. The word “corporate” still suggests a group engaged in some collective project—beyond making money for shareholders—and well into the postwar period corporations continued to define themselves in terms of their products and overall contribution to society. But with the rise of “finance capitalism” in the 1980s, shareholders' profits came to beat all other considerations, even pride in the product. Harvard Business School's Rakesh Khurana, who has recorded the decline of professional management, traces how the idea of the corporation evolved through policy statements made by the Business Roundtable. In 1990, the Business Roundtable representing America's large corporations stated that “corporations are chartered to serve both their shareholders and society as a whole,” including such stakeholders as employees, customers, suppliers, and communities.

In monkey colonies, where rigid dominance hierarchies exist, beneficial innovations do not spread quickly through the group unless they are taught first to a dominant animal. When a lower animal is taught the new concept first, the rest of the colony remains mostly oblivious to its value. One study on the introduction of new food tastes to Japanese monkeys provides a nice illustration. In one troop, a taste for caramels was developed by introducing this new food into the diet of young minors, low on the status ladder. The taste for caramels inched slowly up the ranks: A year and a half later, only 51 percent of the colony had acquired it, and still none of the leaders. Contrast this with what happened in a second troop where wheat was introduced first to the leader: Wheat eating — to this point unknown to these monkeys — spread through the whole colony within four hours.

The rationale for taking up great growth is that firms need to “run with the ball” if they ever get that rare opportunity to suddenly double or triple sales. But there are times when a slower, more controlled growth is sensible. Risks lie on both sides as businesses reach for these opportunities. When a market begins to boom and a firm is unable to keep up with demand without greatly increasing capacity and resources, it faces a dilemma: Stay conservative in fear that the opportunity will be shortened, but thereby give up some of the growing market to competitors; or expand vigorously to take full advantage of the opportunity, but risk being overextended and vulnerable should the potential suddenly fade. Regardless of the commitment to a vision of great growth, a firm must develop an organization and systems and controls to handle it.

It is known that the sum of evaporation and transpiration of water through the leaves of plants will increase with temperature, so that in hot environments, rising temperatures will make rainwater less available for human use and crop production before it evaporates. Rising temperatures will also accelerate the melting of glaciers and snow in the high mountains. Hundreds of millions of people downstream of mountains depend on snowmelt and glacier melt for their water in the spring and summer, and climate change will greatly threaten these vast areas of Asia and the Americas. For some decades, the communities will be threatened by flooding caused by rapid glacier melting, but after that the risk will switch abruptly to water scarcity when the glaciers disappear altogether. Snowmelt will come earlier in the spring and not be available during the dry summer months when crops require water to grow.

Any physical theory is always provisional, in the sense that it is only a hypothesis: you can never prove it. No matter how many times the results of experiments agree with some theory, you can never be sure that the next time the result will not contradict the theory. On the other hand, you can disprove a theory by finding even a single observation that disagrees with the predictions of the theory. As philosopher of science Karl Popper has emphasized, a good theory is characterized by the fact that it makes a number of predictions that could in principle be disproved or falsified by observation. Each time new experiments are observed to agree with the predictions the theory survives, and our confidence in it is increased; but if ever a new observation is found to disagree, we have to abandon or modify the theory.

The good news is that it's never too late to start building up muscle strength, regardless of your age. Ideally, though, it's best to start in your mid-forties when muscle mass starts to decline significantly. "Once you've started, it can take just six weeks to see an improvement of up to 20 percent in your muscle capabilities," says Dr. Ward. Studies have found that intense programs of strength training can help even weak older people double their strength, as well as enable them to walk faster and climb stairs more easily. And muscle isn't all you gain—strength training can help combat osteoarthritis, depression, and risk factors for heart disease and diabetes.

반복되는 어구나 핵심적인 표현을 중심으로 전체적인 글의 흐름과 주제를 파악한다.

여러 연구들의 결과를 근거로 중년에 시작하는 근력 운동이 여러 면에서 효과적임을 설명하고 있다. 따라서 이 글의 주제는 ‘늦은 나이에 시작하는 근력 운동의 효과’임을 알 수 있다.

2  
단계

주제와 관련하여 필자의 생각이나 견해가 드러난 문장 혹은 필자의 견해를 뒷받침하고 있는 문장을 파악한다.

- ➡ ~ it's best to start in your mid-forties when muscle mass starts to decline significantly.
- ➡ ~ strength training can help even weak older people double their strength, ~
- ➡ ~ muscle isn't all you gain — strength training can help combat osteoarthritis, ~

필자는 나이가 든 이후에도 근력 운동을 통해 근력 향상뿐 아니라 골관절염, 우울증, 심장 질환, 당뇨병 등을 예방할 수 있다는 견해를 밝히고 있다.

It has been shown repeatedly that the link between amount of salary and happiness is not as strong as one would expect it to be. Yet we keep pushing toward a higher salary. Much of that can be blamed on sheer envy. As H. L. Mencken, the twentieth-century journalist, social critic, and freethinker noted, a man's satisfaction with his salary depends on (are you ready for this?) whether he makes more than his wife's sister's husband. Why the wife's sister's husband? Because (and I have a feeling that Mencken's wife kept him fully informed of her sister's husband's salary) this is a comparison that is salient and readily available. In like manner, hearing of his colleagues or friends' yachts and vacation homes, a person who has previously been happy with his income suddenly feels very poor and wants to take another route with his career.

We are deeply ambivalent about children. Our attitudes to children are rooted more often in myth rather than in reality. At one moment we see children as innocents and guard them from every real or imagined danger; at the next moment we treat youngsters as monsters from whom society needs protection. Such attitudes serve both children and society badly. Only those with no recollection of the childhood cruelties of the playground or the sports changing room can entertain the illusion that children are unspoiled by the rougher ways of the world. The attempt to protect children from every source of harm or danger will create a generation of young people incapable of looking after themselves. Society needs to be actively concerned with fostering children's capacity to look out for themselves.

The more expert your client is in a given area, the more features (not benefits) that person needs information about to make a decision. Knowledgeable people are going to match your message to what they already have stored in their memory and mind. If you come across as not knowing the actual working details of whatever your idea or proposal is, you lose. If you have quality information, you engage the client and optimize your chances of making the sale. On the other hand, when your client is not an expert in a certain area, less information is generally more likely to be processed more quickly and favorably. In this case, because less is better, you want that message to be very different. You want to share benefits and not features with this client. When the client is not an expert, peripheral cues become crucial.

It cannot be too often repeated that it is not the so-called blessings of life, its sunshine and calm and pleasant experiences that make men great, but its rugged experiences, its storms, and trials. Early hardship, especially, is often a blessing in disguise. It is the rough Atlantic Ocean, the cold, dark, winter nights, the fierce “northers,” that make the British and the American sailors the toughest and most skillful in the world. The training in the school of hardship and sorrow produces the most able pupils, and the hill of difficulty is the best of all exercises for the strengthening of mental backbones. Because our society equates intelligence with school learning, children who have difficulty developing the academically prized capacities are at high risk for feeling “stupid.” Children with reading disabilities, for example, find it difficult to think of themselves as smart. They discount evidence of their intelligence, such as well-developed social skills, clever problem solving in building a soapbox car, or even above-average scores on IQ tests. The mother of one such child told me about an incident that happened when her son Matt was playing at a neighbor’s home. The neighbor later commented, in a surprised voice, “Matt’s really witty! I mean, I knew he was in the special reading group ...” Her voice trailed off as she realized what she was saying, and Matt’s mother, like every parent whose child struggles with academic learning, had to contend with yet another person who felt that such children cannot be intelligent.

In our daily lives, all of us, no matter how determinedly upbeat, rely on what psychologist Julie Norem calls “defensive pessimism” to get through the day. Not only airplane pilots need to envision the worst; so does the driver of a car. Should you assume, positively, that no one is going to cut in front of you or, more negatively, be prepared to brake? Most of us would choose a physician who is willing to investigate the most dire possibilities rather than one who is known to settle quickly on an optimistic diagnosis. In matters of the heart as well, a certain level of negativity and suspicion is universally recommended. You may try to project a thoroughly “positive” outlook in order to attract a potential boyfriend, but you are also advised to find out more about him.
