All art is creation, regardless of how closely the imitation resembles the original. Even the most rigorous attempt to create an absolute likeness is ultimately selective. Doing a portrait, _____ (A) _____, the artist may ask the subject to look serious, not smile — selecting a certain aspect of the person. We know Mona Lisa Giaconda, the subject of the most famous portrait in the world, through her mysterious smile; but we will never know what the entire person was like. The treasure of art, _____ (B) _____, is that its reality lives forever. The final product is really an addition to reality, not simply a way of totally reproducing it. The artist always contributes something new, something that never was put together in precisely that way before. Leonardo's Mona Lisa is not Mona Lisa. The latter has long since gone to her reward; the former will never die.

Fourteenth-century approaches to music had a deep and continuing impact on music and musical life in later centuries. Perhaps most significant was the invention of a precise and unambiguous notation that could record a wide variety of rhythms and allowed music to be distributed in writing and performed accurately wherever it went. We now take this for granted when we play from notation and sight-read through unfamiliar music, but it was a remarkable innovation in the fourteenth century. Among its effects was that composers could fix their music exactly as they wished it to be performed, as poets had long been able to set down their poems, leading them to take pride in authorship as few composers had done before the fourteenth century. In addition, future composers would claim credit for their work more readily and would remain anonymous much less often than was true before 1300.

Whatever the professional musician may hold, most musical beginners still search for specific words with which to pin down their musical ____ (A) _____. That is why they always find Tchaikovsky easier to “understand” than Beethoven. In the first place, it is easier to pin a meaning-word on a Tchaikovsky piece than on a Beethoven one. Much easier. Moreover, with the Russian composer, every time you come back to a piece of his it almost always says the same thing to you, whereas with Beethoven it is often quite difficult to put your finger right on what he is saying. And any musician will tell you that that is why Beethoven is the ____ (B) ____ composer. Because music which always says the same thing to you will necessarily soon become dull music, but music whose meaning is slightly different with each hearing has a greater chance of remaining alive.

The visual arts are nonverbal languages, but in more ways than one might expect. We all know that paintings communicate, and that we are able to derive some information from them more effectively than we can from words.

- (A) But few of us are aware of the fact that obtaining information from an image is not automatic — not even from the most realistic picture of a familiar subject.
- (B) We have to be able to “read” a particular system of distortions that has been used to translate the original three-dimensional scene into a two-dimensional reproduction.
- (C) For example, a great many words would be needed to describe a miracle performed by a saint or what the Rocky Mountains looked like in 1848 with the same degree of detail found in a painted image of such a subject.

The wrapping of Christmas presents, William Waits notes, is a fairly recent phenomenon in American life. It arose at the turn of the 20th century, during a period when hand-made presents were giving way to machine-made, store-bought ones. For both givers and manufacturers, this shift presented a problem, for the machine-made items, precisely because they were convenient, represented less of the giver's personal attention than the hand-made items had done; thus they were symbolically less intimate. To disguise this loss of symbolic value, and to invest the manufactured items with a personal touch, retailers encouraged shoppers to have their purchases gift-wrapped. Gift-wrapping, in Waits's acute term, became a 'decontaminating mechanism' that removed the presents from the 'normal flow of bought-and-sold goods' and made them, for a single ceremonial moment, emblems of _____ rather than commerce.

* emblem 상징

- ① intimacy ② disguise ③ generosity
④ convenience ⑤ encouragement

Words & Phrases

- fairly 상당히
- arise 일어나다
- shift 변화, 변천
- attention 배려, 정성
- disguise 감추다, 위장하다

One way of looking at trust in personal relations centers around your fears of rejection. Let us look at the progressive disclosure of personal information as part of the process of building trust. You show some trust in another by making a disclosure that is a little ① risky. If the other is ② supportive about your disclosure, trust is likely to be enhanced. Trust may be further enhanced if the other risks ③ disclosing at a similar level of intimacy. However, if the other person ④ accepts your initial disclosure, you are unlikely to risk deeper disclosures and may even end the relationship. Where both of you feel relatively ⑤ safe, you may be prepared to continue testing and building trust by disclosing at a slightly deeper level.

Today's TGV drivers, however, spend their working day comfortably seated in a warm or air-conditioned cab.

In the late 1940s, the train drivers in France had been doing dangerous manual work — operating steam engines — for upwards of four decades. (①) By retirement in their early fifties, they were exhausted: often sick and with a life expectancy rarely in excess of ten years. (②) Generous pensions were the least they could reasonably ask, and the burden on the state was easily tolerated. (③) The nearest they come to manual labor is when they press a series of electric switches to activate their machinery. (④) For them to retire before the age of fifty-five appears absurd. (⑤) Thanks to the medical and other provisions of the French welfare state, such men may reasonably expect to live well into their eighties, which places a significant burden upon the public finances.

Rarely are people recruited to an executive team because their strengths are the best complement to those of the existing team members. When is the last time you heard a leader talking about how your team needed to add a person who not only had the technical competence but who could also help build stronger relationships within the group? The vast majority of the time, we recruit by job function—and all but ignore individuals’ strengths. What’s worse, when leaders do recruit for strength, they all too often pick people who act, think, or behave like themselves, although unintentionally in most cases. It’s an age-old dilemma. How is a company supposed to grow, adapt, and change if a domineering CEO continues to pick people who agree with him and who have a similar background and personality?

* domineering 권력을 휘두르는

- ① 기존의 조직을 보완해 줄 수 있는 사원을 선발해야 한다.
- ② 사원의 복합적인 업무 수행 능력 향상이 경영의 핵심이다.

Let’s say an ant in a colony stumbles upon a new food source. No dictator ant has to tell the colony to reorganize itself to harvest that source. Instead, one ant, in the course of his normal searching, stumbles upon the food. Then a neighboring ant will notice that ant’s change in direction, and then a neighbor of that ant will notice the change, and pretty soon, as Steven Johnson puts it, “_____.” The entire colony will have a pheromone superhighway to harvest the new food source. A change has been quickly communicated through the system, and the whole colony mind has restructured itself to take advantage of this new circumstance. There has been no conscious decision to make the change. But a new set of arrangements has emerged, and once the custom has been set, future ants will automatically conform.

The essence of science is to uncover patterns and regularities in nature by finding algorithmic compressions of observations. But the raw data of observation rarely exhibit explicit regularities. Instead we find that nature's order is hidden from us, it is written in code. To make progress in science we need to crack the cosmic code, to dig beneath the raw data and uncover the hidden order. I often liken fundamental science to doing a crossword puzzle. Experiment and observation provide us with clues, but the clues are cryptic, and require some considerable ingenuity to solve. With each new solution, _____. As with a crossword, so with the physical universe, we find that the solutions to independent clues link together in a consistent and supportive way to form a coherent unity, so that the more clues we solve, the easier we find it to fill in the missing features.

* cryptic 비밀스러운

- ① the depth of scientific experiments keeps us in awe
- ② we glimpse a bit more of the overall pattern of nature
- ③ the code-breaking process becomes increasingly mysterious
- ④ the regularity of nature is revealed in its entirety to the observer
- ⑤ we crack the cosmic codes one by one, replacing an old solution with the new one

Many fruits, vegetables, and flowering trees depend on pollinators, such as honeybees, for their reproduction.

- (A) These include loss of habitat of the pollinators (for example, forests), invasive species of parasites (for example, fire ants that attack honeybee populations), viral infections transmitted from abroad, and large-scale use of pesticides, which kill the pollinators.
- (B) Indeed, the fruit industry spends vast sums of money on bee pollinators. There is now a mass decline in the wild populations of many pollinators, including honeybees, and also a replacement of native pollinators by unsuitable invasive species.
- (C) The results will be declining crop productivity and rising food costs. There is, as with the other areas of disastrous biodiversity decline, a multitude of interacting factors, probably all of which are contributing to the decline.

Our brain is a great computing machine, but it also places some obstacles in the way of apprehending reality truthfully.

There is no question that the brain-mind mechanism is one of the most glorious achievements of evolution. (①) Unfortunately, despite its many amazing features, it has also developed several procedures that are less desirable. (②) Every impressive evolutionary adaptation winds up blocking other possibilities: the bat has an exceptionally sensitive sonar but poor eyesight; the shark can't see well either but has a fantastic sense of smell. (③) The first of these is the nervous system itself. (④) The more that is known about how the mind works, the more we realize that the filter through which we experience the world has some peculiar built-in biases. (⑤) If we do not understand how these biases work, thoughts and actions are never truly going to be under conscious control].
